

## Earth has a fifty-fifty chance of hitting 1.5 degree Celsius threshold soon

According to United Nation's IPCC study the world is likely to hit the threshold of 1.5 degrees very soon. UN experts warn the governments of the impending danger that can bring utter devastation across the world.

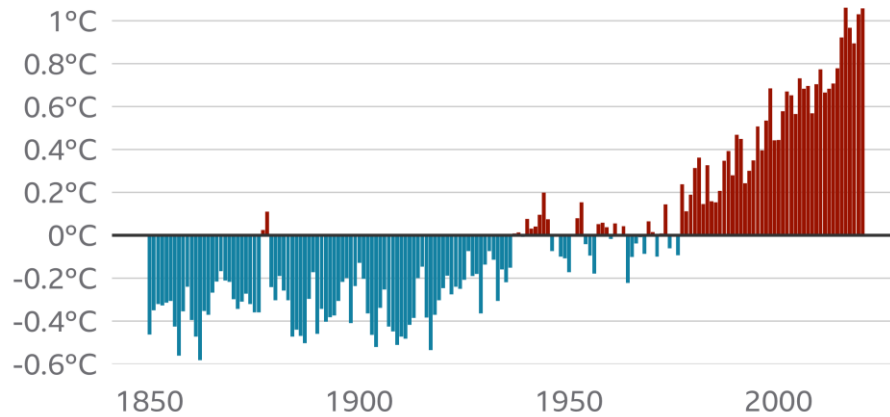

Recently, a study has been conducted by IPCC, in which 234 authors from 66 countries participated. The study suggests that the global average temperature could rise or exceed 1.5 degrees in the next 20 years. In five years, if necessary measures are not taken temperature will start to rise globally.

Fires in Greece and Turkey have horrified people. In coming months, a lot more fires are expected as the temperature continues to rise.

Our message to every country. Government, business and parts of societies is simple, follow the science and embrace your responsibility to keep the goal of 1.5 degrees alive, said Alok Sharma, president of COP26.

## The world is getting warmer

Annual mean land and ocean temperature above or below average, 1850 to 2020

Note: Average calculated from 1951 to 1980 data

UN scientists give a wakeup call to the world to cut emissions. Global average temperature could exceed limit by 2040 if crucial steps are not taken. The temperature rise will breach the ambition of the 2015 Paris Climate Agreement. It can bring widespread devastation and extreme weather.

Rising temperature will bring more draughts and rainfalls to various regions around the globe. As the levels continue to rise, there are major chances of floods. If the governments do not put necessary measures into practice, global warming will bring devastating results.
